

DA Capstone: Footprint Logger Platform

A local environmental group wants a web platform that lets users track daily activities contributing to carbon emissions, view summaries, and get tips to reduce their footprint. Users should be able to log activities, see running totals, track their highest-emission behaviours, and optionally compare to a community average.

Learner Task

Build a web application with the following features:

1. Activity Logging

- Users can select or input daily activities (e.g., car travel, meat consumption, electricity use).
- Each activity has an assigned CO₂ value.
- Show a running total of emissions.
- Display a visual summary (e.g., bar or pie chart).
- Allow filtering by category (food, transport, energy).
- Persist activity data using **localStorage** for single-session tracking.

2. User Accounts & Dashboard

- Implement user registration and login (Node.js, Express, MongoDB).
- Store and retrieve user-specific activity logs.
- Display a dashboard showing:
 - Individual logs
 - Total emissions summary
 - Optional comparison to community average
- Show weekly summaries or streaks.

3. Insight Engine

- Analyse user activity to identify highest-emission categories.
- Display personalized tips or weekly goals based on activity.

- Track progress toward weekly reduction goals.

Submission Instructions:

- Push your final code to a public GitHub repository
- Ensure all work is merged into the main branch (do not submit a branch)
- Submit **only the repository link** on Google Classroom (no file uploads)

Submission Requirements

- Written submission (structured sections)
- Ensure a professional-style tone
- Provide clear headings
- Save your capstone as a PDF and submit it in Google Classroom
